

Annual Weather Summary over Thailand in 2015

In 2015, the majority of Thailand was much warmer and drier than usual. Annual rainfall averaged over the country of 1,419.6 mm was 168.1 mm (11%) below the 1981-2010 normal. During early rainy season due to a combination of the absence of the monsoon trough influences and El Nino episode, unusual dry and warm conditions occurred in Thailand. The annual mean temperature of 27.9 °C, 0.8 °C above normal, was the second warmest year in Thailand on 65 years record same as 2010 (the warmest year is 1998). The mean temperature was above normal for all months especially December and November which was 2.1 and 1.9 °C above normal, respectively. The maximum temperature reached the new highest record in several areas. Besides, there was only one tropical cyclone namely “VAMCO (1519)” that moved into northeastern Thailand at Ubon Ratchathani province on September 15. The details are as follow.

In January and February, the weather in the morning over Thailand was cool nearly the whole areas, especially in the northern and northeastern parts where cold weather was reported in several places and very cold weather was found in some places with extreme minimum temperature, 5.7 °C, at Nakhon Phanom Agromet.Stn. in Nakhon Phanom province on January 14 and was 3.0 °C in the area of mountain top at Royal Agricultural Station Angkhang in Chiang Mai province on February 18. While daytime temperature increased with hot weather, causing highest variation of diurnal temperature in February. However, the mean temperature during this period was below normal almost the whole country. Unseasonable rain for few days especially in northern and central parts brought 23.9 mm (41%) above normal rainfall over Thailand in January.

Late February, the southerly and southeasterly winds brought warmer condition and summer season to Thailand. After that, heat low pressure cell occasionally covered upper Thailand causing generally hot weather with very hot weather in several areas till May. Mean temperature over Thailand was clearly above normal especially 1-2 °C above normal in all regions in May with new highest record of daily maximum temperatures in some areas. The maximum temperature recorded of the year was 43.1 °C at Si Samrong in Sukhothai province on April 20. Moreover, unseasonable rain with thunderstorms, gusty winds and hails was intermittently reported. Nevertheless, summer rainfall was below normal in most areas of Thailand. The maximum daily rainfall in this summer was 175.0 mm at Phu Kradueng National Park in Loei province on April 24.

May 2015 was actually drier than usual with less and uneven distribution of rain, monthly rainfall was 46 % below normal, the lowest of the year. However, during May 21-23 Thailand

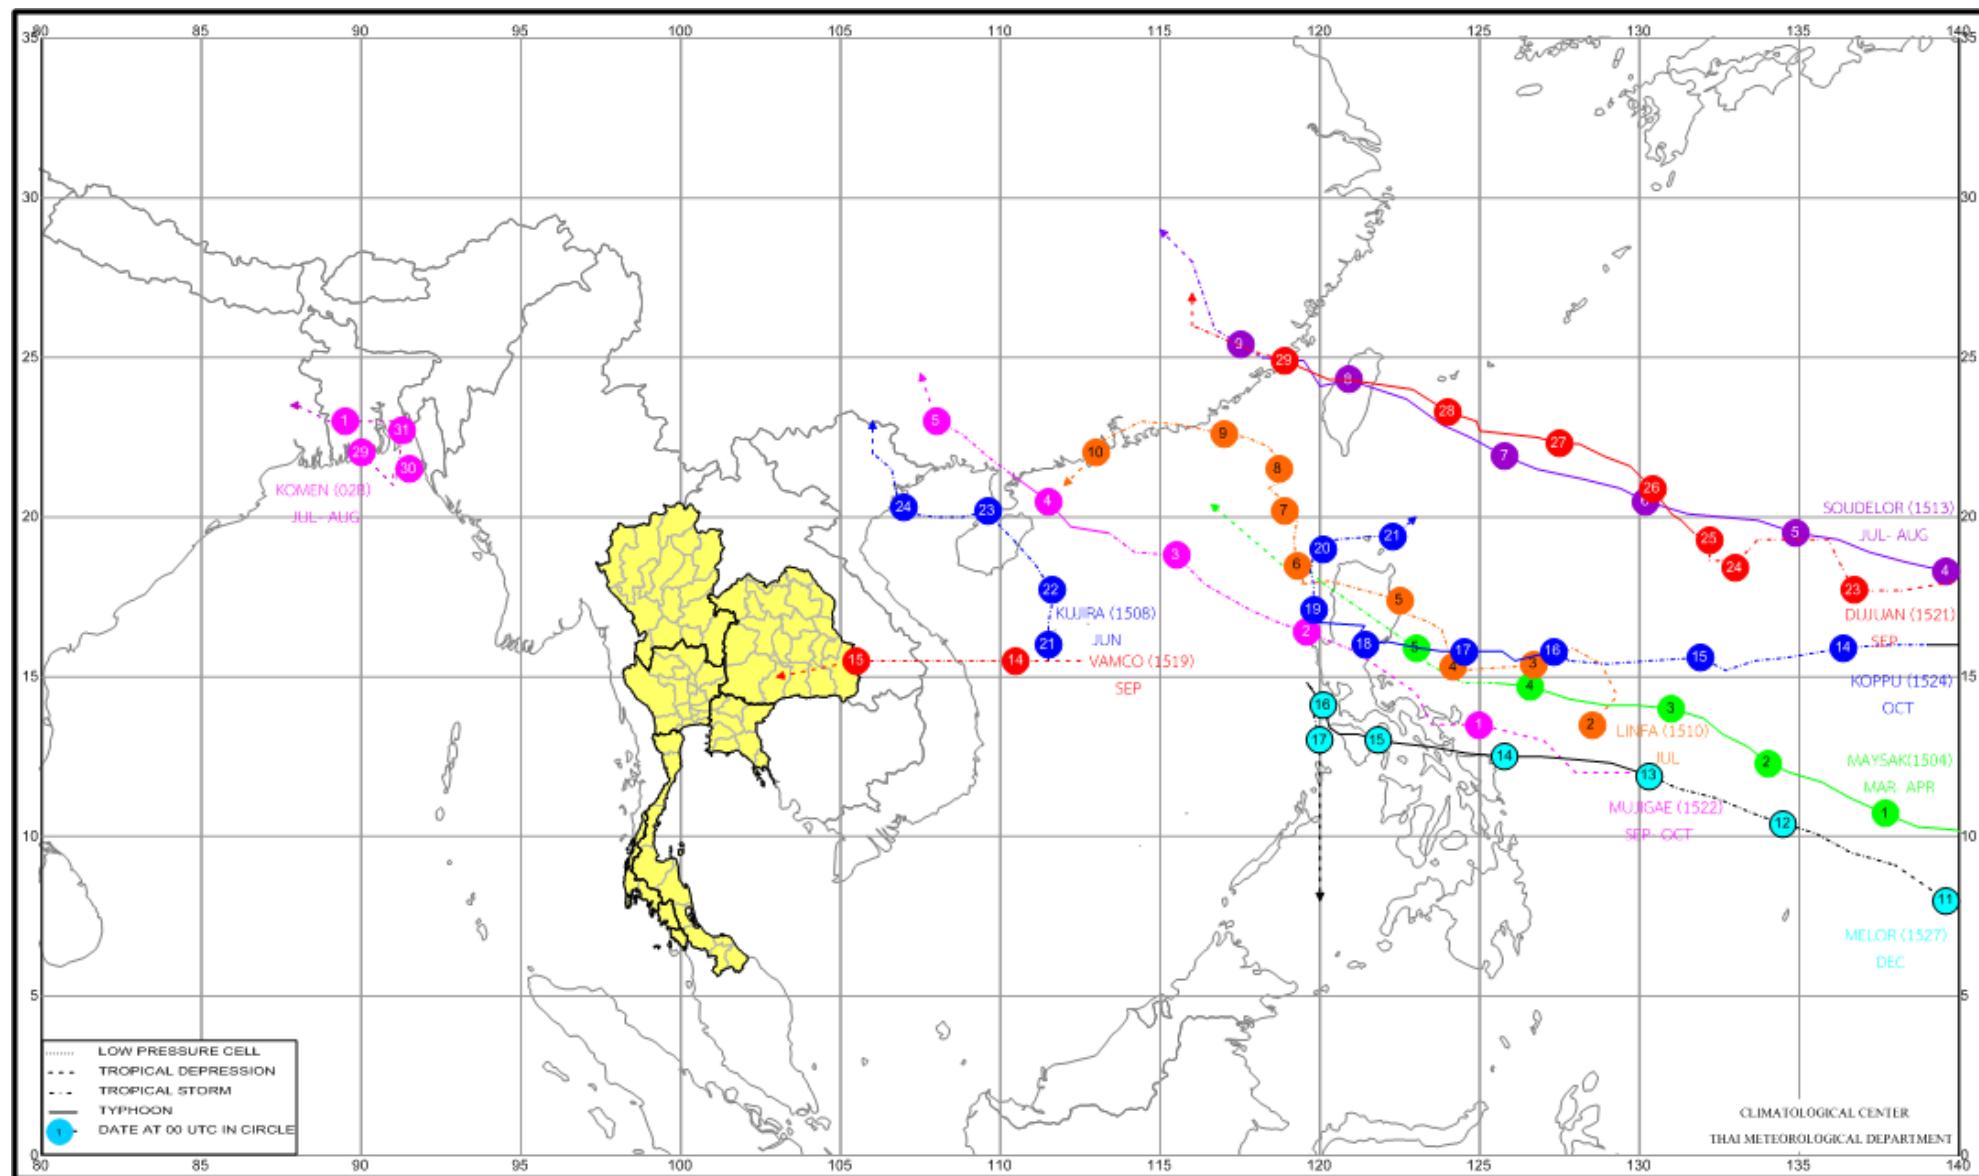

experienced successive rainfall in many areas that considered as the beginning of the rainy season of the year on May 22. After that, there was scanty rainfall and hot to very hot weather in some areas mainly in upper Thailand until mid-July. The maximum temperature in several observation stations soared to a record-breaking with more than 1 °C beating the previous record in some areas. The maximum temperature recorded of the rainy season was 41.1 °C at Chai Badan in Lop Buri province on June 11 and at Kamalasai in Kalasin province on July 3 and 4. However rainfall was increasing when the tropical cyclone “KUJIRA (1508)” located in the upper Vietnam during late June with the low pressure cell in the Gulf of Tokin and Vietnam in July. Moreover, abundant rainfall and flash floods in some areas of central, eastern and southern Thailand affected by tropical storm “VAMCO (1519)” which moved to Thailand as tropical depression at Khong Chiam, Ubon Ratchathani province in the morning of September 15 before moving further to Myanmar and the Gulf of Bengal on September 18. Monthly rainfall in July and September was 5% and 4% above normal respectively. The highest daily rainfall of 2015 was 300.3 mm at Rattanawapi in Nong Khai province on July 28.

Upper Thailand prolonged plentiful rainfall with flooding in some areas during early October then temperature and rainfall continuously decreased in northern and northeastern parts. Thailand turned to winter during late October. Moreover, during November and December, a pattern of high pressure area from China extending to cover upper Thailand was mainly propagated eastward to dominate the South China Sea resulting in an overall mild winter across Thailand with intermittent cool weather in the northern and northeastern parts. Mean monthly temperature of this period was anomalous warmth in all parts of the country particular in upper Thailand where notable warmth exceeds 2.0° C above normal. For rainfall, with the passage of the westerly trough over upper northern part coupled with the easterly wave moving through lower northern, central and eastern parts, upper Thailand periodically experienced unusual rainfall during late year causing above normal monthly rainfall in most of upper Thailand. In southern part, monthly rainfall was below normal especially in the east coast although rainfall was produced by the influences of northeast monsoon almost the period with the low pressure cell in the lower southern part and lower portion of the Gulf of Thailand during 23-24 December. Monthly rainfall over the country in November and December was below normal. The highest daily rainfall was 200.9 mm at Ban Na San in Surat Thani province on November 29.

Note: Rainfall amount, temperatures and natural disasters are the preliminary information.
